Giseh! (Detlef Kessler, 2001)

A game for 2 players, ca. 35-45 min.

Translated from the original German rules by Víctor M. González, February 17, 2013.

Game content

- A game board with an 8x8 grid of round notches
- 2 x 102 playing pieces (balls), two different colors
- A few replacement balls
- Rules

Note: The game can be played by up to four players using 2 x 77 balls (two additional colors) that can be purchased separately.

Setting Up

Each player takes the complete set of balls of one color and should have access to all sides of the game board.

Goal of the Game

The point of the game is to lay as many rows of four in your own color as possible as you build the pyramid.

Game play

- A player is chosen to take the first turn.

- On his turn, a player places one ball of his color.

- A ball can be stacked [level n+1] on a 2x2 square of mutually adjacent balls [level n].

- A player who manages to place four of his balls in a row scores one point (horizontal, vertical o diagonal lines formed by four same colored balls resting on the same level, or else four same colored balls resting on four consecutive levels in a straight line).

- If, during the game, a four-in-a-row placement is covered by enemy balls, the player who had scored one point does not lose it. Besides, he now has the opportunity to continue the disrupted placement in order to score one point doing another four-in-a-row. Once earned, scored points cannot be lost.

- Multiple four-in-a-row placements can be simultaneously achieved by just placing a ball that happens to rest at the end of several three-in-a-row series.

- If a fifth-ball of the same color is placed at the end of a four-in-a-row series, no additional points are scored.

- Once the pyramid is finished, the player with the most earned points is the winner.

- During the game, placed balls are partially or completely covered. This balls are no longer actively participating in the game. (As noted above, no points can be lost due to balls being covered during the game).

- A pencil or other straight object can be used for unambiguous identification of a four-in-a-row series. The four balls must be placed so that they define a clear and uninterrupted line. Therefore, the pencil should touch all four balls when used to identify a true four-in-a-row placement.

- This rules can be modified or complemented with home rules in order to devise new games playable with the Giseh! game components.
