

Cirondo

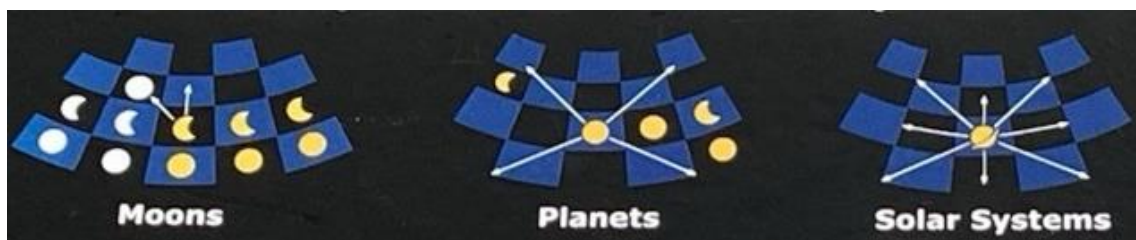

1991, Angus Wright, <https://boardgamegeek.com/boardgame/6355/cirondo>

The game is played on the following board and setup,

each player as 16 *worlds*, 16 *moons*, and 4 *solar systems*
the board center is denoted as the **void**

To start the game, each player in turn moves one of their Moons one space towards the center of the void.

- **Moon.** Normally a Moon can only be moved directly forward (i.e. towards the void) one space. The exception is when the Moon takes an opponent's stellar (i.e., Moons, Planets or Solar Systems). It can only take an opponent's stellar by Moving one space diagonally in either direction towards the void. When a Moon reaches the innermost circle, it is immediately sucked into the void and re-emerges as a Solar System on the space previously occupied by the Moon (The Moon is now removed from the game!).

- **Planet.** A Planet may only move diagonally along the arcs. It can move as many spaces as possible along the arcs, towards or away from the void. If an opponent's stellar is in its path it can stop on any space before it or land in the same space to eliminate it from the board. It must not deviate from the arcs path.
- **Solar System.** When a Solar System is in play it can move any number of spaces in any one direction i.e. directly towards or away from the void; along an arc towards or away from the void; or in an orbit around any ring.

The path of any Stellar's movement is limited by the void, the outer edge of the board or by another Stellar occupying a space on that path.

When a player lands his stellar on an opponent's stellar, the opponent's stellar is eliminated and removed from the board. It is then the turn of the next player.

Goal. The object of the game is to conquer the galaxy by eliminating your opponent from the board.

- When a player has only one stellar remaining on the board defeat must be conceded on that player's next move - unless the opponent also has only one Stellar; the winner is then the player with the higher powered Stellar (if the Stellar are of equal power then the result is a draw). A Solar System has the highest power, then a Planet, then a Moon.
