This is a connection game played on a square board,

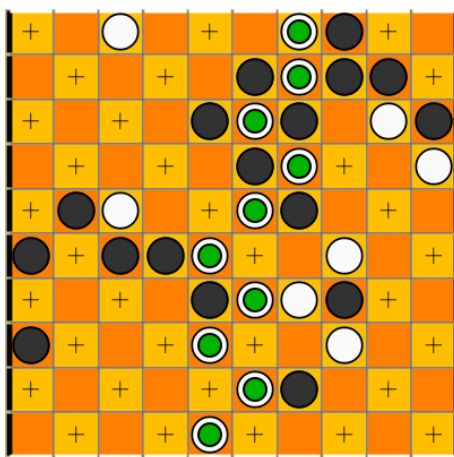

Black connects horizontally, White vertically

Each player, in his turn, makes two placements in the following order:

1. First place an enemy piece on an empty light square, next to as many of your own pieces on adjacent dark spaces as possible.
2. Then place your own piece on an empty dark space.

As soon as a placed color makes a connection (orthogonal and diagonal connections are valid), that color wins.

winning path for White

Note: These restrictions tend to form clumps of pieces with both colors. The maximization requirement creates more tactical impacts for your 'hot' placement to influence your opponent's choices for 'cold' placement. In the illustrated game. White won by forcing Black to place a white piece on E8, because it was the only available light space neighboring 2 black pieces.
