LAG is a new-generation game that reimagines traversal games, typified by Halma, with a fresh twist. In LAG, a piece moves a distance equal to the number of friendly groups; the game ends when neither player can move any further, and the player with fewer groups wins (this naturally includes situations where all your pieces have traversed the board).

COMPONENTS

- A hexagonal board with 5-hex per side
- 11 pawns each in white and blue, and 1 cube of each color

SETUP

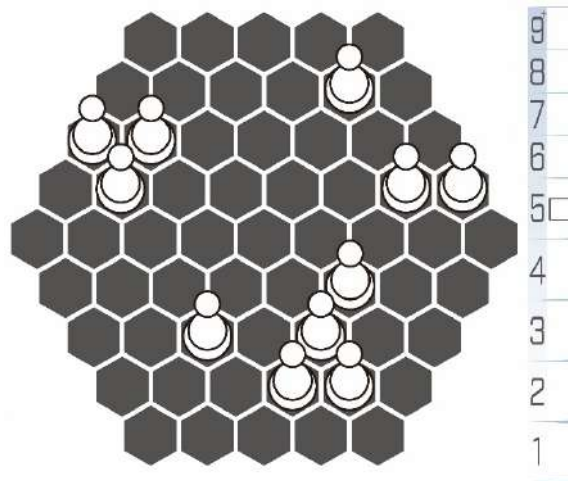

Assign colors to the players in any way and place your pawns on the side closest to you, as shown in the diagram. Place your cube beside the “1” on the meter on the right side of the board.

(Fig.1) Setup

DEFINITIONS

A set of pawns of the same color that are adjacent to each other is called an **object**. A single pawn that is not adjacent to any friendly pawns is also considered an object.

(Fig.2) White has five objects on the board (Blue pieces are omitted).

GAMEPLAY

Starting with the white player and turns alternate. Each player moves one of their pawns according to the movement rules described below. Passing is not allowed.

After a move is made, both players should check the number of their own objects on the board, and if there is a change in the count, move their cube to the corresponding number on the meter.

to the backside ⇒

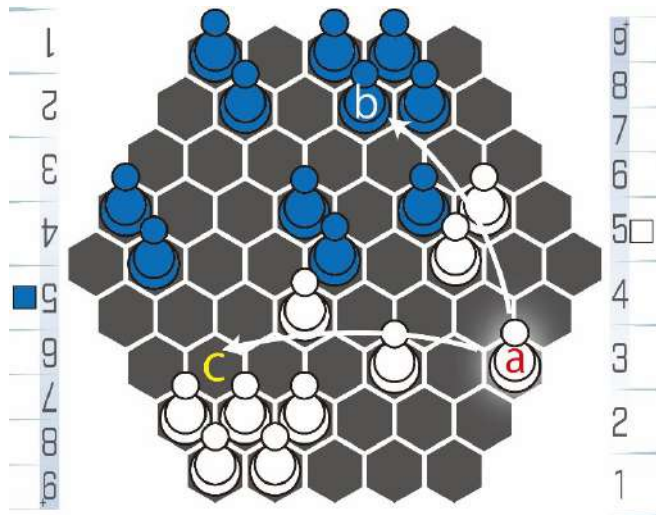

MOVEMENT RULES

A pawn moves exactly the same distance in one direction as the number indicated by your cube on the meter (i.e., the number of objects).

It may jump over any number of pawns in between, but it cannot move off the board or to a space occupied by a friendly pawn. If an opponent's pawn is on the destination space, that opponent's pawn is captured and removed from the game, and the moving pawn takes its place.

MOVEMENT RESTRICTIONS

Pawns normally move only forward but are allowed to move sideways only if doing so reduces the number of your objects on the board. They cannot move backward in any case.

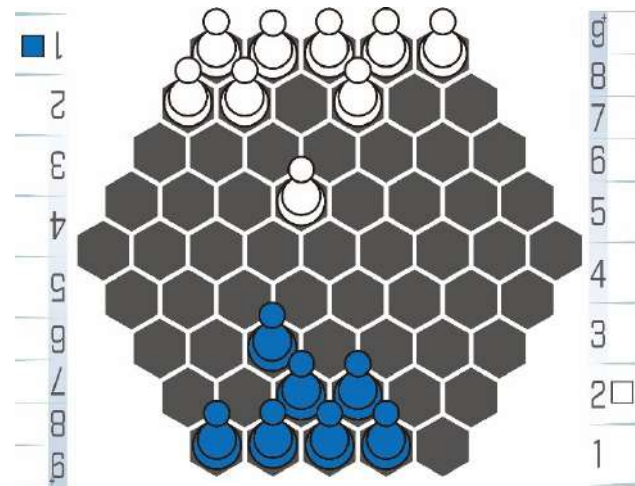

(Fig. 3) If White moves the pawn at **a**, they can either capture and replace the opponent's pawn at **b**, or move to the position at **c** to reduce the number of their objects from 5 to 4.

GAME END

If the active player has no legal movements, the game ends immediately.

The player with fewer objects at the end of the game wins. If both players have the same number of objects, the active player who ended the game wins.

(Fig. 4) Since White could not move on their turn, the game ended, and Blue, who had fewer objects, won.

STRATEGY TIPS

Beginners often end up carelessly increasing the number of their objects, which can lead to a loss of control over their moves. At first, it's best to keep the number of your objects to no more than four or five.

Capturing your opponent's pawns usually gives them an advantage, but there are situations where increasing your opponent's number of objects through capture can actually lead to your own victory.
