A 12x12 board, initially empty, with one Reversi stone and enough walls,

endgame example

Setup. Player 1 places the stone, black side up, on any square. Player 2 chooses their side: either keeps the black pieces (and Player 1 switches to white and moves) or moves the stone and plays with the white pieces.

Move the stone one square (orthogonally or diagonally), flip it and place a wall on a free side of its new square. The stone always shows the color of the one who moved it. The walls do not cross.

If a wall leaves squares isolated from the stone, the color visible on the stone claims them. They are no longer played, and each one is worth 1 point.

Goal. The game ends when the stone is left alone on its square, which does not score points. The player with the most squares in their territory wins.
