Bugs under Rugs

2026, Rey Alicea, https://boardgamegeek.com/boardgame/481817

Setup. The bugs start on the baseboards. Each player takes three alternating sides of the outer ring, one bug per cell. One rug goes on the center cell and the rest in mirrored pairs (180°) inside the room, never on the outer ring. Red moves first. For a pie rule, one player lays out the rugs and the other picks a color.

Swarms. A swarm is a group of your exposed stacks that touch each other. A lone stack is a swarm by itself. Stacks under rugs never count. Your swarm count is your move length, so both players start at 3.

Your turn. Move one whole stack you control (your color on top) exactly as many cells as your swarm count, in a straight line, in any of the six directions. It may jump over anything but may not leave the board. Stacks never split: once bugs are stacked, they stay together for the rest of the game.

- **Toward the middle:** a stack may never end farther from the center than it started.
- **Around:** ending on the same ring is allowed only to land on a rug, climb an enemy stack, or reduce your swarm count.

Landing.

- **Rug:** crawl under it. You may join your own stack already hiding there.
- **Enemy stack:** climb on top; you now control it, under a rug too.
- **Your own exposed stack:** not allowed.

Under the rug.

- A single-color stack under a rug cannot move.
- A mixed stack under a rug can be moved by whoever is on top, but only closer to the center. Dragging it out exposes every bug in it.
- If all your stacks are hidden, your swarm count is 0 and you cannot move.

End and scoring. With no legal move you pass. Two passes in a row end the game. Lift the rugs: each rug's whole stack scores for the player on top, one point per bug. Ties go to whoever controls more rugs, then to whoever made the last move.
