

Game of Hordes

2026, Mike Zapawa, <https://boardgamegeek.com/thread/3752839>

The game uses a 12x12 square board rotated to 45 degrees. Each player needs a sufficient supply of 'City' and 'Soldier' tokens.

initial setup

Definition. A soldier that doesn't neighbor an empty square in one of the three 'forward' directions is considered **smothered**.

On your turn, first perform one of two actions: **move** or **recruit**, and then **remove all smothered enemy soldiers**.

- If you **move**, make as many single-step forward moves as you have cities. You can't skip moving until you've made as many steps as you have cities, or until you have no legal moves. You can't step onto a square occupied by another soldier. Moving onto a friendly city doesn't consume a step, but you can't end your turn there. Moving onto an enemy city immediately ends the game as your win.
- If you **recruit**, turn one of your soldiers that isn't orthogonally or diagonally adjacent to any city into a city. Then, place as many new soldiers on the board as you have cities. The new soldiers must be dropped on spaces orthogonally

or diagonally adjacent to your cities. You can drop fewer soldiers, or none, if you want to.

You immediately win the game if you move a Soldier into an enemy City, or the enemy runs out of soldiers.
