2026, Francesco Salerno, <https://boardgamegeek.com/thread/3754939>

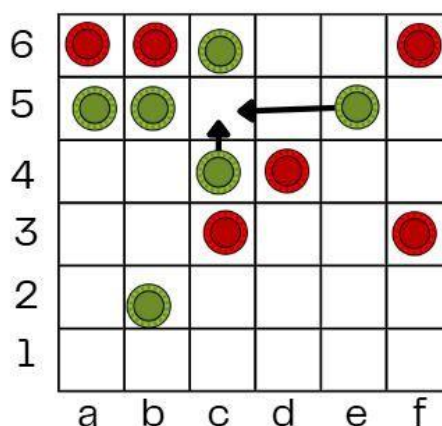

The goal of the game is to connect your home row with the opponent home row by using your pieces. Diagonally and orthogonally adjacent pieces of the same colour are considered connected.

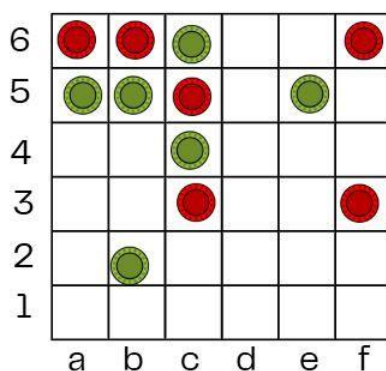

The game is played on a squared 6x6 board, with six pieces per player. Pieces are all identical, you can use checkers. The game starts with all your pieces aligned in your home row.

On your turn, move one of your pieces by sliding it in a straight line in any direction, (orthogonal or diagonal) but *you must move it until it reaches an obstacle* (another piece of either colour or the edge of the board). The piece cannot stop before reaching an obstacle, cannot jump over other pieces, and cannot capture any piece.

Exception: It is not allowed to limit one or more opponent pieces to an area that has no possible path to the rest of the board.

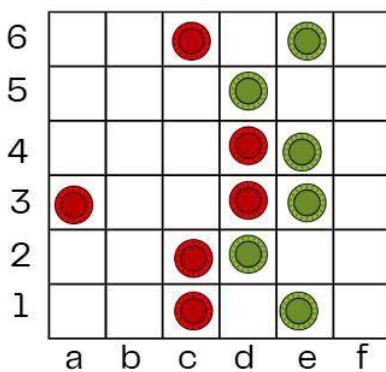

c4-c5 and e5-c5 are not allowed as they would block a6 and b6

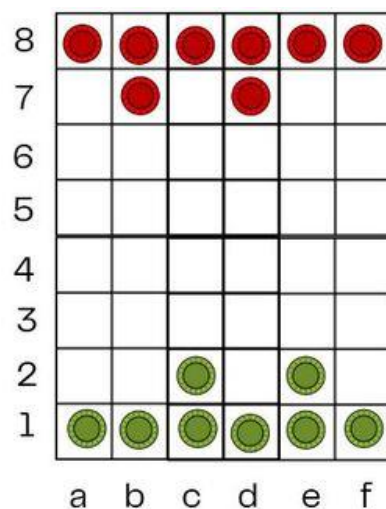

This position instead is legal because a6 and b6 are connected to c5 (and they can reach the rest of the board, even if it requires potentially many moves).

The game ends immediately when the two home rows are connected by the pieces of the same player.

green wins.

Alternative setup: rectangular 6x8 board (6 columns and 8 rows). Using 8 pieces per player. The starting set up could be as in the diagram below.
