

REPELLO

A Game of Great Consequence.

The goal in REPELLO is to push as many objects as possible off the board. *Repellers* and *Stacks* that are pushed over the edge are worth points and the player with the highest score at the end of the game wins.

Black, silver and gold Repeller.

In REPELLO all objects, Repellers and Stacks, push each other when getting too close. By moving your Stack you will be able to start chain reactions that may spread over the entire board, sending valuable Repellers off the edge and into your collection, scoring you points.

Each time you make a move your Stack will leave a Repeller where you stood, so the board will constantly be filled.

The player that best manages to control the chain reactions stands a very good chance of winning!

REPELLO in brief:

Move Your Stack

Find the best direction for your Stack in order to create rewarding chain reactions.

Resolve The Conflicts

A move is completed when all conflicts are resolved; there is a gap between all remaining objects and balance has been restored on the gameboard.

Collect Your Earnings

All objects you have pushed off the board score you points!

Preparations

Each player choose a Stack color. Take a seat at the correspondingly colored side of the gameboard.

Load the Stack with black Repellers. The game length can be adjusted by the number of Repellers loaded on

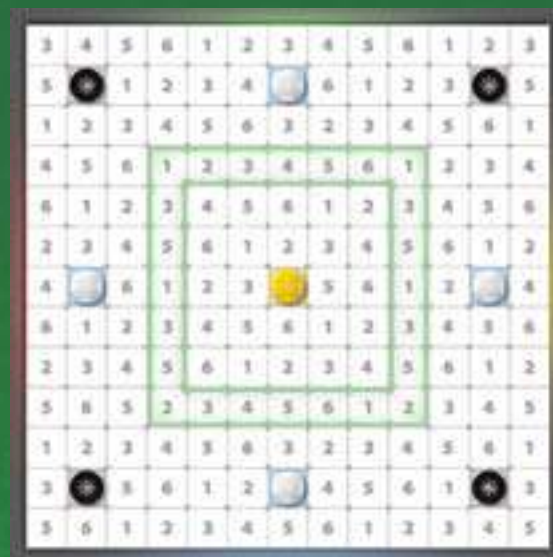

the Stacks. For a game of normal length, following is recommended:

2 Players – 15 Repellers each

3 Players – 12 Repellers each

4 Players – 10 Repellers each

Also place Repellers on the board; 1 gold, 4 silver and 4 black, according to the figure below. This is the starting set up.

Start setup. Starting zone is shaded in green. The board is graphically simplified for clarity.

Starting the game

Decide who starts. In clockwise turn, each player takes a starting position by placing the Stack on any of the green-shaded squares in the starting zone. There must be at least one empty square between the Stacks!

Press gently on the colored top every time you place your Stack. The stacked Repellers are pushed flat against the board making the Stack stand steady and upright. When all Stacks are placed in the starting zone, player one makes the first move.

Rules

Making a move

You make your move with your own Stack. When lifting it, your Stack shall always leave a Repeller in the square it just left. This will happen automatically when placed properly.

You may move your Stack in any straight or diagonal direction. The first square in each direction tells you the number of squares to move in that direction (see image below). Since the Stack may not pass through or stop at an occupied square, some directions may be blocked.

When moving your stack it may bounce on the edges of the board (see image below). If hitting the edge diagonally (in a 45 degree angle), the Stack will bounce back out diagonally the other way. If it comes in straight (90 degrees) or into a corner, it will bounce back along the same way it came in. Remember that the Stack leaves a Repeller where it stood, and that this Repeller may not be passed when bouncing back!

On rare occasions, a Stack is blocked in all directions so that the player is unable to move. The Stack shall then be placed on any free square in the green starting zone (leaving a Repeller behind as usual). If the stack is placed next to another object, the conflicts need to be resolved before the turn is done (see Resolving conflicts next).

Explanatory image showing the possible movements of each Stack in the game. As you can see, some directions are blocked by objects. Note that red may bounce straight while green can't. The Repeller left behind is blocking its way on a straight bounce but green can do a diagonal bounce!

Resolving conflicts

If a Stack or a Repeller, ends up in a square next to another object, there is a conflict. The two will *repel* each other, meaning that they will push each other and it is up to you that are making the move to decide which object pushes which! An object is always pushed one square and always straight away from the pushing Stack or Repeller.

REPELLO is all about seeing the possibilities in each given situation. Here, red player is about to make a move...

Red decides to move three steps straight to the left. The bottom Repeller is left behind. Red has now caused a conflict that need to be resolved...

Red may push the two Repellers one step away from the Stack. This way, the conflicts are resolved without scoring.

However, red could just as well let the left Repeller push the own Stack to the right. This way, the gold is pushed over the edge and you score 5 points!!

Note that the square numbers only applies for the initial Stack movement, and that a Stack does not leave a Repeller behind if it's pushed around later in the move! A pushed object might end up next to a third object, and a new conflict has occured. When moving your Stack you will set off chains of reactions.

At some points a single move will start a major reaction causing many, simultaneous conflicts. You resolve conflicts one at a time and there is no priority to the order of resolving conflicts. Your goal is to find chain reactions that pushes objects off the board to score points, and in each conflict you choose which object pushes which.

A move is completed when no more pushes are possible meaning that there is now a gap between all remaining objects and "balance" has been restored on the gameboard.

Sometimes, three or more objects can end up in a row, so that one or more objects are "locked" in the middle. When this happens, the "outer" objects are always pushed first. In this case of three objects, the middle object is locked until one of the outer objects is pushed. Then you can push either of the remaining two objects that are still in conflict with each other. Resolved cleverly, situations like this one can work out very well! This player scored 5 points by pushing the gold Repeller off the board.

Over the edge

The goal is to use the chain reactions to push objects over the edge. Note that edge bounces only applies to the initial movement of the Stack! When your move is finished you collect and save the Repellers that have been pushed off the board. These are worth points at the end of the game.

Stack over the edge

Another great way of gaining valuable Repellers is pushing your opponents Stacks out. Note that you are not allowed to push your own Stack off the board. When a Stack gets pushed out the following happens:

- 1) The pushed out opponent has to pay you the bottom Repeller from his/her Stack (if there is any left that is! During the last round, Stacks may be out of Repellers).
- 2) You also get to choose any one Repeller from the pushed out opponent's collection (if any). So aim for players who have silver or gold Repellers!
- 3) The pushed out player re-enters the game (at his/her next turn) by placing the Stack on any free square in the green starting zone. If the stack is placed next to other objects, the conflicts need to be resolved before the move is completed.

End of the game

The number of Repellers on the Stacks marks the number of rounds left to play. Tip: By altering the number of Repellers loaded when starting the game, you can adjust the duration of the game!

During the last round of the game all Stacks will run out of Repellers. Although a player has made his/her final move, the empty Stack is still in the game and can still be pushed off the board (see above). Not until the last player has ended his/her last move, the game is over!

Points

- Black Repeller — 1 point
- Silver Repeller — 3 points
- Gold Repeller — 5 points

When the last round is finished, all players count their points and the one with the highest score wins! If two or more players end up with the same score, the player with the golden Repeller wins. If none of them have the golden Repeller, the player with the most silver Repellers is the winner. If the Score, most unlikely, is still the same, it's a draw after all...
