Pentad

2026, Rey Alicea, https://boardgamegeek.com/thread/3768881

Setup. Black places one stone on an empty cell. White does the same. Black moves first then turns alternate.

Place a stone of your color on an empty cell in line of sight of one of your own stones (straight line, any of the 6 hex directions). No legal cell? Pass.

Denote N as the number of stones of either color that can see that cell.

Looking outward from your new stone in all 6 directions, the first enemy stone spotted in each direction is either pulled N steps toward you or pushed N steps away — you choose one for the whole turn.

Win. First to get five of your own stones in an unbroken line (any of the hex's three line directions) wins — including if a pull/push accidentally completes it.

If the board fills up (two passes in a row): largest connected group of stones wins; ties go to whoever moved last.
