

形棋-Shape Chess-

Designed by Richu

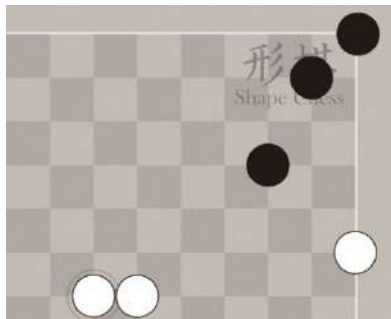

2 players / 30-60 minutes / 8 years and older

Shape Chess is a game in which players use their pieces to create line-symmetric shapes. Using three types of actions (drop, jump, and push), players aim to create symmetrical groups of six or more pieces. Try to get four points while successfully blocking your opponent!

COMPONENTS

- Square board with 13×13 intersections
- Black and white pieces (35 each)
- Score tokens (10)

During the game, pieces are placed on the intersections of the board, not on the cells. The edges of the board and the areas with the logo printed on them can also be used.

(Fig. 1) Example of possible placements

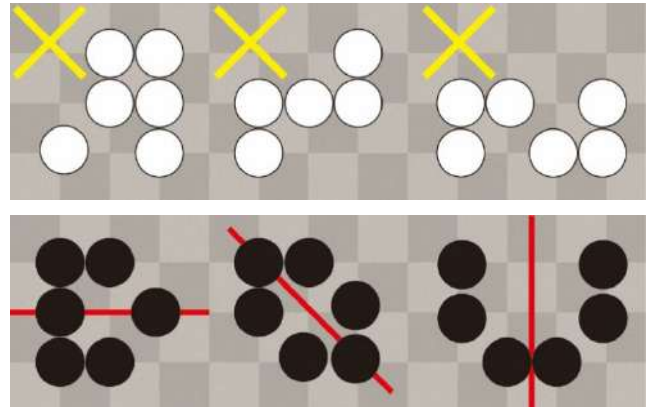

There is no limit to the number of pieces that can be used under the rules. If you run out of pieces during play, you can use substitutes such as pieces from other games.

SETUP

Decide which player will use white and which will use black and take all of your pieces. Place all of the score tokens next to the board.

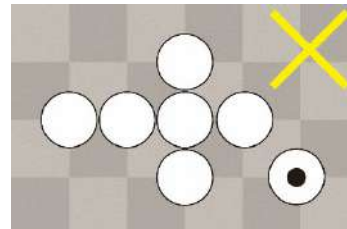

SHAPE

A group of pieces of the same color connected vertically, horizontally, or diagonally is called a "shape." When a shape is line symmetrical, it is called a "symmetrical shape."

(Fig. 2, 3) Examples of non-symmetrical (top three) and symmetrical shapes (bottom three)

Symmetrical shapes must not be part of a larger non-symmetrical shape. In other words, if there are extra pieces of the same color connected that break the line symmetry, the shape is not considered symmetrical.

(Fig. 4) The left shape is not a symmetric shape because the bottom right piece with the dot breaks the line symmetry.

GAMEPLAY

Players take turns starting with the black player. On your turn, you must perform one of the following three actions:

- a) **Drop** - Place one of your pieces on any empty intersection.
- b) **Jump** - Take one of your pieces on the board and move it to any empty intersection.
- c) **Push** - Move one of your opponent's pieces on the board to an adjacent empty intersection (diagonally is allowed), then place one of your pieces in the position where that piece was.

(Fig. 5) Examples of three types of actions

After you take action, if you have one or more symmetrical shapes consisting of six or more pieces,

- (1) Remove all pieces that make up your symmetrical shapes from the board and return them to your hand,
- (2) Earn $N-5$ points for each symmetrical shape consisting of N pieces, and earn one scoring chip for each point, and
- (3) Take another turn.

Your symmetrical shapes are removed and scored only after your action.

GAME END

The player who scores a total of 4 points wins immediately.

The number of points required to win can be changed by prior agreement.
