

Impedio

2026, Kashio Fujii, <https://boardgamegeek.com/boardgame/478262>

initial setup

There are 30 White pieces and 30 Black pieces

Definitions

- **Stack:** A pile of one or more pieces stacked on a single board space (cell).
- **Line:** A straight row of intersecting spaces (cells) running across the board.

On each turn, you must split and move one stack of your color according to the following rules:

- Stacks move strictly along a single line. A moving stack may jump over any number of stacks (both friendly and enemy) in a single move.
- The exact distance (number of spaces) the moved portion travels must equal the number of pieces left behind at the original space.
 - For example: If you separate a stack of 2 pieces from a original stack of 5 pieces to move it, you must place the 2-piece stack exactly 3 spaces away from the original position (since $5 - 2 = 3$ pieces remain).
 - Since a move must cover at least 1 space, a single-piece stack (1 piece) cannot be split or moved to another space.
- You cannot move off the board or onto a space occupied by an enemy stack. However, you can merge your moving stack into another friendly stack.

You win as soon as you meet either of the following conditions:

- Connect any pair of opposite sides of the board (out of 3 pairs) with stacks of your color.
- Connect any set of three non-adjacent sides of the board (out of 2 sets) with stacks of your color.

You lose if you have no legal moves on your turn.
