Quantum Control

Designed by Néstor Romeral Andrés + Kanare Kato

2 players / 40 minutes / 8 years and older

Quantum Control is a game based on Néstor's Quantum Leap, with random elements removed and area control objectives added by Kanare Kato. The movement rules are identical to those of the original Quantum Leap, and some of the strategies are shared. The objective is to secure a majority in more areas than your opponent.

COMPONENTS

- A hexagonal board with 49 blue and 12 gray spaces
- 25 black pieces and 24 white pieces

The game board consists of seven areas surrounded by circles, each containing seven blue spaces, and 12 gray "gap" spaces between them. The gaps are not included in the areas.

(Fig.1) Area and gaps

SETUP

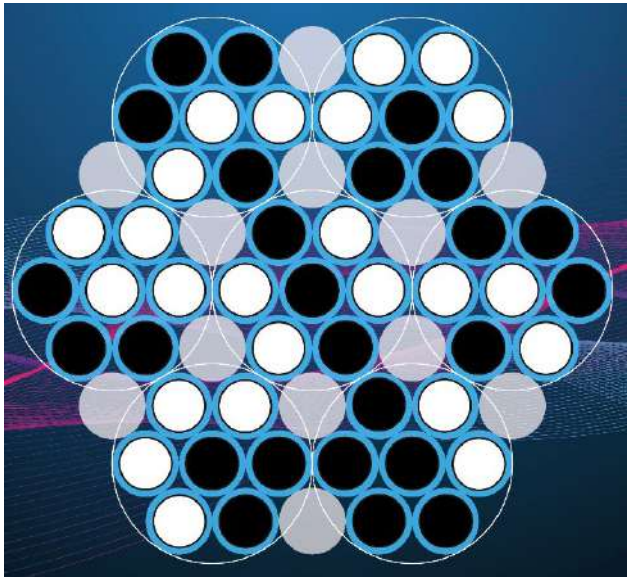

The board is initially empty. Assign a color (white or black) to each player in any appropriate way and receive all the pieces of your color.

GAMEPLAY – FIRST PHASE

Players take turns starting with Black. First, Black places one of their pieces on any empty blue space.

Thereafter, starting with White, players alternately place two of their pieces on empty blue spaces. The two pieces must be placed in different areas whenever possible. The phase ends when all blue spaces are filled.

(See also VARIANT (BLITZ RULES) at the end)

(Fig.2) Example at the end of Phase 1. Note that no pieces are placed on the gray spaces.

to the back side⇒

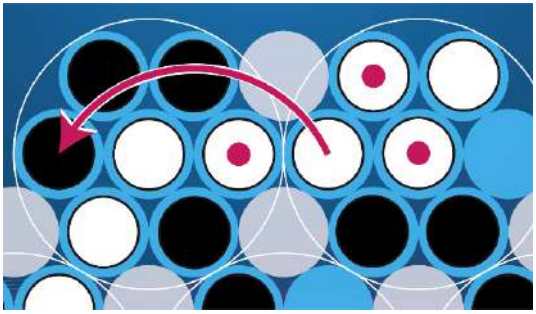

GAMEPLAY -SECOUND PHASE

Starting with White, players take turns moving one of their pieces according to the following rules and capturing one of their opponent's pieces. A move without capturing is not allowed.

A piece moves in a straight line a distance exactly equal to the number of adjacent friendly pieces (including in different areas). The opponent's piece at the destination is captured and removed from the game.

Grey gap spaces can be jumped over when moving. Like blue spaces, these spaces also count as one space.

The active player may choose to pass instead of making a move (it differs from Quantum Leap). If the player cannot move, they must pass.

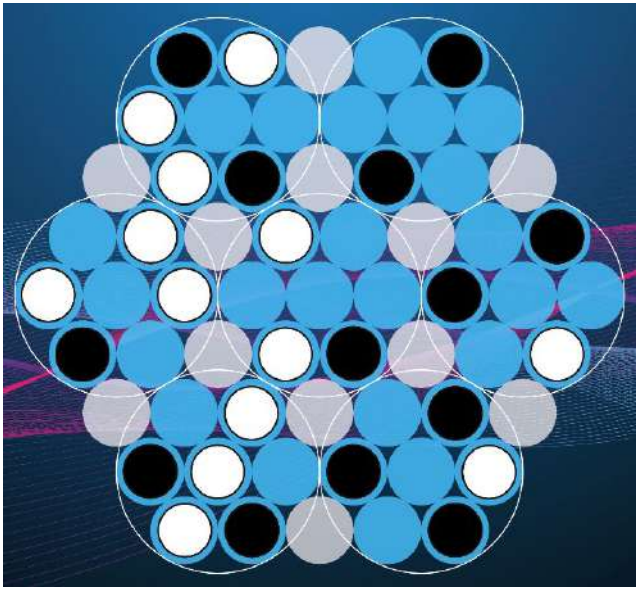

(Fig.3) Example of a move. Since the white piece in the diagram is adjacent to three friendly pieces, it moves three spaces forward in a straight line and captures the black piece at its destination.

GAME END

The game ends when both players pass successively or when neither player has any legal moves left, then check the number of pieces remaining in each area.

The player with more pieces remaining in an area claims that area. If both players have the same number of pieces in an area, neither player claims it.

The player who claims the most areas wins the game. If both players have claimed the same number of areas, the player who made the last move wins.

(Fig.4) Example at the end of the game. Since White has a majority in four areas, the White player wins.

VARIANT (BLITZ RULES)

Instead of playing Phase 1, one player randomly places all the pieces and then makes adjustments, after which the other player chooses their color based on the resulting layout. The rest of the rules remain the same.
