Facet

2026, Corey Clark, https://boardgamegeek.com/thread/3767532

Facet is a game of getting the most representation you can around every distinct region of the board. The game was inspired by a simple misunderstanding of the rules of Federa because of a glitch on iggamecenter. To make a long story short, I wondered about a game where you wouldn't simply try to maximize the number of pieces around a region but you would try to maximize your color's representation around the entire perimeter.

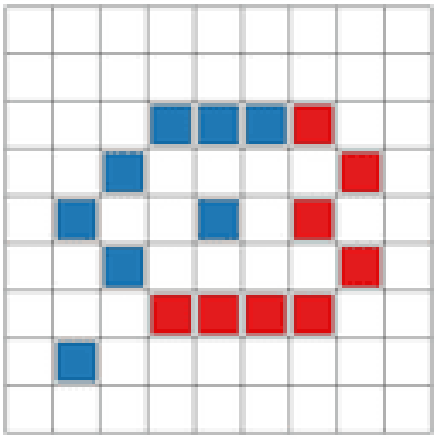

Materials: any odd sized square board and an unlimited supply of stones in two colors.

Definitions

- **Face:** a *face* is any one of the sides of a square to which a stone belongs; each stone has up to 4 faces depending on the surrounding stones
- **Region:** a *region* is a maximal set of empty spaces which can be reached through orthogonal steps between unoccupied cells. Note: this can include the entire board
- **Control:** You *control* a region if you have **more** faces touching that region.

Gameplay: Starting with red turns alternate. Player 1 must not make his first move in the center. From then on players either place a single stone or fill in a region they control with their stones.

Objective: The objective of Facet is to have the most stones when the board is full.

Here, despite red having more stones around the inner region, blue has 2 more faces touching it and thus can fill it in. Meanwhile the outer region is tied 15-15 and neither player controls it.
