

Romette

1891, Ayres Publ., <https://mats-winter.github.io/bg/romette.htm>

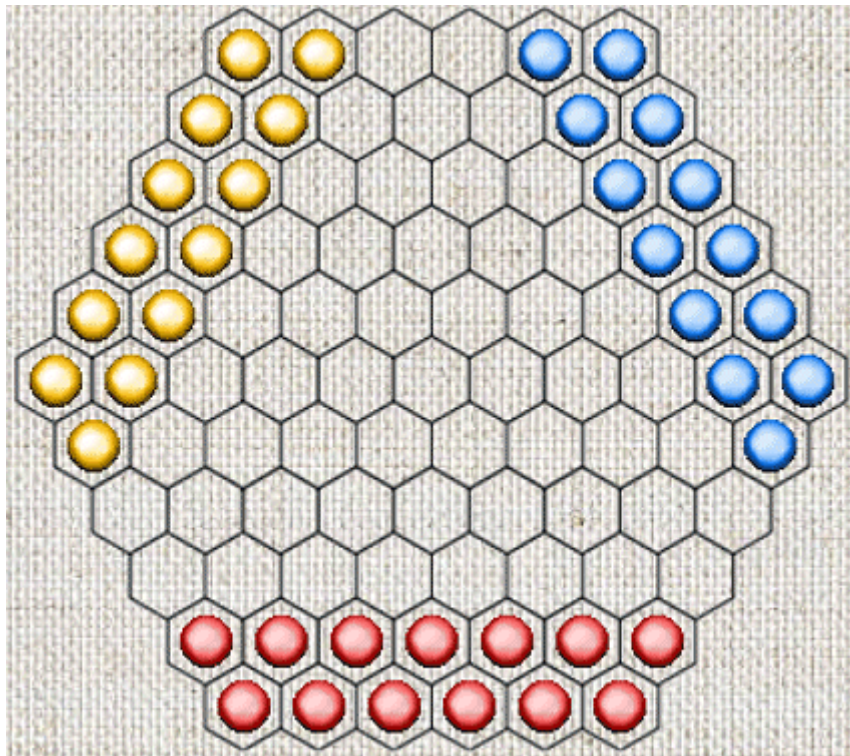

Romette is a race game for two or four players. Stones may move to any adjacent empty square in all eight directions. They may also jump over a single stone or a continuous row of stones of any colour. A jumping sequence may continue if further jumps are available, or the player may choose to stop early.

- Forced outjump: If a stone from the opposite side (but not the other enemy stones) stands orthogonally or diagonally in front of a stone that has not yet left its home zone, an outjump is mandatory. [Although the original rules do not mention an outjump requirement, this addition improves gameplay.]
- Winning condition: A player wins when all of his stones have reached the opposite side of the board

[Mats Wither description]

Mats Wither designed a hexagonal variant of this game, **HexRomette**:

HexRomette is a race game for two or three players. A stone may move to any adjacent empty square in any of the six directions. It may also jump over a single stone or over a continuous line of stones of any colour. A jumping sequence may continue if further jumps are available, though the player may also choose to stop early.

A player wins when his goal zone on the opposite side of the board is filled with stones of any colour. This eliminates the tactic of blocking the goal.

[Mats Wither description]

Mats also made a ZRF to [play the game](#), and another with [the original rules](#).
